Bloom

A Shared Ecosystem for Healthy and Productive Habits

Supervised by Rehab Dwairi | CMPS499

Introduction

Bloom is a proposed ecosystem of four connected apps for exercise, study, task management and reading. Each provides tools for its activity and contributes to a shared screen-time credit system.

The project targets individuals and families.

Objectives

1. Provide four dedicated activity workspaces.
2. Connect activities to a shared screen-time balance.
3. Support parent and child modes in each app.
4. Synchronize progress and credits across supported devices.

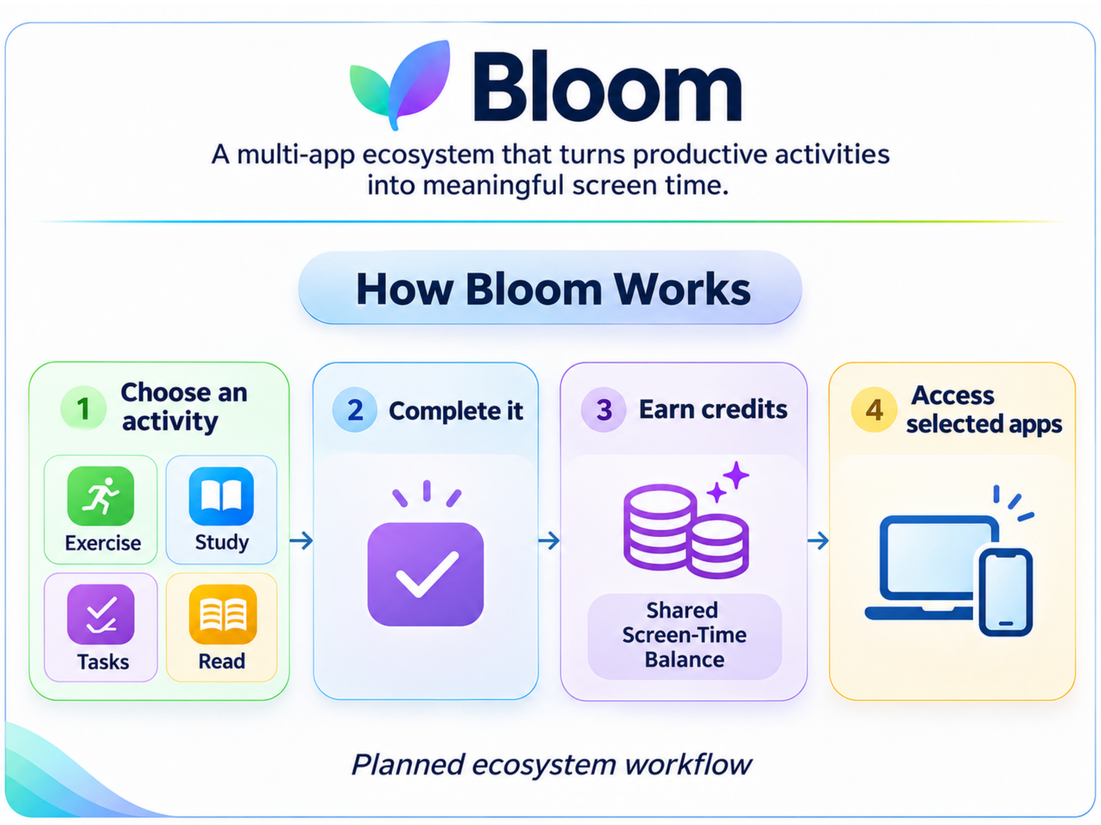

Market Research

A 2017–18 survey of 370 Education City university students found that 64.9% met the study's physical-activity benchmark. [1]

FitBlock awards screen time for exercise. MoveToPlay provides parent-managed activity rewards. ScreenCoach supports activity rewards across family devices. [2–4]

Bloom proposes dedicated workspaces linked to a shared credit system. User demand remains to be evaluated.

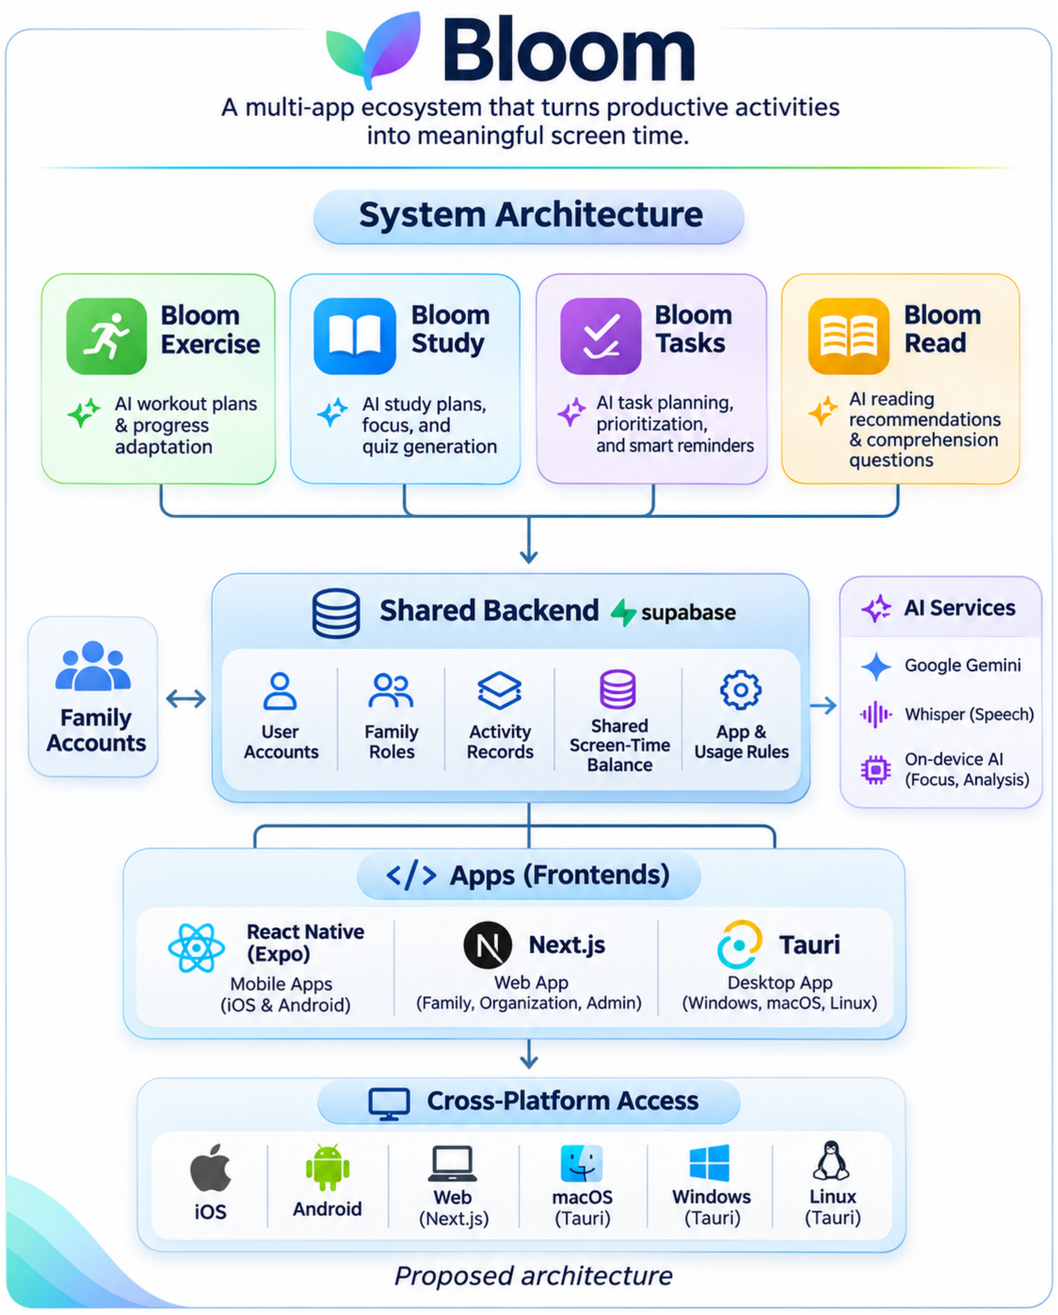

Methodology

Planned ecosystem workflow

Planned workflow: complete an activity, earn credits and use them for access to selected apps.

System Architecture

Proposed architecture

Results and Current Status

Concept illustration

Conclusion

The exercise implementation and separate Bloom Exercise family controls exist in the repository. The four-app shared system is proposed. No project evaluation results are available yet.

Next: develop the remaining apps and validate synchronization, family workflows and blocking on supported devices.
