Nashaat

A Shared Ecosystem for Healthy and Productive Habits

Ayham Dwairy (202313830) · AbdulNaser Rabbie (202211579)
Amer Alzawawi (202205054) · Abdelrahman Abdelvahed (202207121)

Supervised by Rehab Dwairi | CMPS499

Introduction

Nashaat is a proposed ecosystem of four connected applications for exercise, study, task management and reading. Each provides tools for its activity while contributing to a shared screen-time credit system.

The project targets individuals and families who want to connect activity, progress and screen-time management.

Objectives

1. Provide workspaces for exercise, study, tasks and reading.

2. Connect activities to a shared screen-time balance.

3. Support parent and child modes in each app.

4. Synchronize accounts, progress and credits across supported devices.

Market Research

Qatar context: In a 2017–18 survey of 370 Education City university students, 64.9% met the study's activity benchmark. [1]

Direct competitors: FitBlock rewards exercise with screen time. MoveToPlay offers parent-managed activity rewards and selected-app blocking. ScreenCoach supports family activity rewards across managed devices. [2–4]

Nashaat proposes dedicated activity workspaces sharing one credit system. User demand for this combination remains to be evaluated.

Methodology

Design the four activity workspaces and shared services. Record eligible activity and award credits to a common balance. Connect supported devices and apply selected-app restrictions using platform integrations.

Evaluate the workflows, synchronization and blocking on supported devices, then collect user feedback.

System Architecture

ACTIVITY WORKSPACES
Exercise Study Tasks Reading

SHARED BACKEND · PROPOSED
Accounts and family roles
Activity records and progress
Screen-time credit balance
Cross-device synchronization

DEVICE INTEGRATIONS
Selected-app restrictions on supported platforms

Parents and children are intended to use role-specific controls across all four apps.

Result and Current Status

The repository contains exercise-focused software for workout plans, sessions, credits and platform integrations. A separate Bloom Exercise app includes family account controls.

The study, task and reading apps, shared cross-app balance and family modes across all four apps are planned.

No project evaluation results are available yet. User impact and device reliability have not been established.

Conclusion

Nashaat proposes a connected system that supports productive activities and links them to screen-time credits.

Next steps include developing the remaining workspaces, connecting shared services and evaluating family workflows, cross-device synchronization and blocking on physical devices.
